WORK EXPERIENCES

Software Engineer Intern, VERZENA

August - December 2024

- Collaborated with a small engineering team in an early-stage startup developing scalable web and cloud-based digital solutions. Contributing to designing early prototypes in **Figma** and implementing dynamic page layouts using **JSX** and **Tailwind CSS** with interactive UI components, ensuring consistent styling and efficient rendering across platforms.
- Developed **Client Side components** for interactive UI features and **Server Side pipelines** for efficient data fetching, deploying the application using Cloudflare CDN and DNS infrastructure to improve page rendering performance and reliable hosting.
- Designed and implemented a complete user portal system with secure login and authentication using **Prisma** and **PostgreSQL**, designing relational database schemas and optimized queries to efficiently manage user accounts and application submission workflow.

TECHNICAL SKILLS

Language: Java, Python, C++, R, JavaScript, Php, SQL (Postgres, Oracle), HTML/CSS

Frameworks: React, Vite, TailwindCSS, Next.js, Node.js, Javax, JUnit

Developer Tools: Git, GitHub, VSCode, IntelliJ, Word, Excel, Powerpoint, Figma, Jupyter, Slack, RStudio

PROJECTS

[MyBinder](#) | Next.js 14, Python, React Query, Supabase, PostgreSQL, TailwindCSS 

- Deployed a full-stack Pokémon card binder from scratch, allowing users to create and organize cards into digital binders with customizable page and grid layouts, and share collections via read-only links using Next.js Dynamic Routing
- Created a web scraping pipeline to aggregate and normalize the complete Pokémon card catalogue from pkmncards.com, integrating React Query for client-side caching to minimize API calls and improve card search performance.
- Implemented Supabase authentication and PostgreSQL database schema with Row Level Security (RLS) policies to enforce per-user data isolation across binder and slot tables, while exposing public read access for shareable binder links via unique share tokens.

[CookAI](#) | React, Vite, MongoDB, JavaScript, PostgreSQL 

- Collaborated with a team to engineer a full-stack AI Recipe Generator, integrating ChatGPT API to produce personalized meal recipes from phone snapshots of home leftover ingredients
- Created the UI/UX design using Figma, with focus on wireframing, prototyping, and applying user experience principles for an intuitive interface to improve ingredient selection flow and recipe readability.
- Debugged JavaScript API response handling and React state management (useState & useEffect) with test cases to ensure consistent and accurate recipe generation outcome.

[ScanAhead App](#) | React, TypeScript, SupaBase, Gemini API, ElevenLabs API, KIRIEngine API 

- Co-developed a full-stack medical triage prototype for patients to submit symptom reports by leveraging multi-API integration including Gemini, KIRI Engine, and ElevenLabs for speech-to-text transcription, converting videos of affected body areas into 3D scans, and generating structured AI clinical summaries for doctors to review.
- Designed and Implemented a responsive Bento Box grid layout for the patient and doctor dashboards, and organizing key information cards into a visually structured UI to improve readability and quick access to case summaries and appointments.

[Game Platform Systems](#) | Java, SQL (Oracle), Git 

- Collaborated with a team of 3 in Git to create a practical database application using PostgreSQL for users to manage game metadata, third-party news, and user-generated reviews.
- Designed an intuitive GUI using JFrame, JTable, JButtons, and JPanel from javax.swing package for user interaction.
- Utilized SQL Queries including joins, nested queries, aggregation, and constraint for filtering features

[Movie Review Website](#) | SQLite, Php, XAMPP, JavaScript, HTML, CSS 

- Developed a comprehensive multi-page movie review website from scratch using Svelte Framework and JavaScript.
- Implemented user login, session handling, and CRUD operations for reviews and ratings using PHP and SQLite.
- Utilized PHP for backend logic and SQLite for persistent data storage, allowing dynamic review submissions, sorting system to display average movie ratings, and secure user authentication.
- Deployed a local Apache environment with XAMPP to manage database connectivity and backend routing.

EDUCATION

University of British Columbia

B.Sc., Statistics, Concentration in Computer Science

September 2022 - April 2026

Vancouver, Canada

VISIÉR

858 Beatty Street #400,
Vancouver, BC V6B 1C2

Re: Software Developer Co-op

Dear Hiring Team,

I am writing to express my strong interest in the Software Developer Co-op role at Visier. This role stood out most for me is Visier's mission to build real products and systems that help companies across the globe to plan, decide, and work with confidence. That is exactly the kind of work and environment I want to grow in, where the code I write have a direct impact that goes well beyond the internship itself.

I am finishing my final term as a Statistics major with a concentration in Computer Science at UBC, with experience spanning full-stack development, data systems, and AI integration. My two strongest projects are ScanAhead and MyBinder. ScanAhead started when my friend and I noticed that patients in Vancouver were hesitant to seek help because of the frustration of navigating the clinic system to find the right doctor. We built a triage prototype where patients submit symptom reports through voice, images, 3D scans, and text which are processed through a multi-API pipeline integrating KIRI Engine and ElevenLabs. Finally, using GeminiAI to build structured clinical summaries for doctors before a patient's first appointment. MyBinder project pushed me deeper into the data layer, where I built a full-stack Pokémon card binder using Next.js 14, React Query, Supabase, and PostgreSQL, including a web scraping pipeline to obtain the full Pokémon card catalogue in csv, React Query caching to keep search fast under load, and a PostgreSQL schema with Row Level Security to enforce per-user data isolation while exposing public read access via unique share tokens.

Aside from my personal projects, I have built and shipped a complete product during my 4-month internship with Verzena, a Vancouver-based startup offering development solutions for businesses. I worked directly with the founders from day one, starting with their brand identity - company logo, color system, and visual hierarchy, then applying them into a functional website with a layout that guides users naturally around the reviews, case studies, and services. Working closely with a team and end-users taught me how to communicate clearly across different levels of understanding and deliver real solutions.

What draws me most to Visier is that the code I produce would actually matter. I wish to contribute to Visier's mission in helping companies use data insights and AI in the workflow to guide better business decisions.

Thank you for taking the time to read this. I would love the chance to bring my values, my technical background, and my work ethic to the Visier team. Feel free to reach out by email or phone if any additional documents are required.

Yours sincerely,
Aronn Laurel
